SOLUZIONI FOODSERVICE

BOROSILICATE GLASS is a material highly resistant to thermal shock and washing. Its chemical composition is such that it does not alter the acidity level of the liquid it comes into contact with.

The vacuum created in the interspace between the two walls allows for thermal insulation of the liquid contained and prevents the formation of condensation on the outside of the container. The result is a greater maintenance of the temperature of the hot and cold liquid compared to containers of common glass or porcelain and ceramics.

They reduce the creation of condensation on the external surface thus avoiding the deposit of water on the contact surfaces and on the hands.

CHARACTERISTICS:

- Handmade double wall borosilicate glass.
- Resistant to thermal shock.
- Microwave and dishwasher safe.
- Maintains the temperature of both hot and cold drinks/food.
- Does not alter the acidity of the liquid/food it contains.
- Avoid the formation of condensation outside.
